CLAIMS

10

15

What is claimed is:

- An optical device comprising:
 programmable elements formed on a surface of a substrate,

 said elements being selectively programmed to create a reflective filament pattern,
 said surface of said substrate for reflecting radiation in a selected optical pattern.
 - 72. The device of Claim 1 wherein said elements are formed in a two dimensional array.
 - 3. The device of Claim 1 wherein each of said elements has conductive contacts, and wherein said contacts are selected from metals consisting of aluminum and aluminum alloys.
 - 4. The device of Claim 1 wherein said elements are selectively programmed to create a reflective filament pattern to convey information.
 - 5. The device of Claim 1 further comprising an address decoder on said substrate for selectively addressing said elements for programming.
 - 6. The device of Claim 1 further comprising optical fibers receiving reflected light from filaments of programmed elements.
 - 7. The device of Claim 6 wherein said fibers are located proximate to said surface of said substrate.
- 20 8. The device of Claim 1 further comprising a light source providing light upon said surface of said substrate for reflecting light from filaments of programmed elements.
 - 9. The device of Claim 1 further comprising a second substrate having a photosensitive material that is selectively exposed by light reflected from filaments of programmed elements.

- The device of Claim 1 further comprising an optical element positioned with 10. respect to said surface for focusing light on filaments of programmed elements.
- The device of Claim 1 further comprising an optical element for focusing light 11. reflected from filaments of programmed elements.

- The device of Claim & further comprising a package containing said substrate, 12. said package having a window exposing said elements, said package having conductive terminals for programming said elements.
- The device of Claim 1 wherein said elements comprise less than 100 elements. 13.
- The device of Claim 1 wherein said elements comprise more than 100 elements. 14.
- The device of Claim 1 wherein said elements comprise more than 1,000 elements. 15.
- The device of Claim 1 wherein said elements comprise more than 1,000,000 16. elements.
- The device of Claim 1 further comprising: 17.
- a light source positioned to have light reflected off said surface of said substrate corresponding to said filament pattern; and

a photosensiti/e layer receiving the reflected light.

- The device/of Claim 17 wherein said photosensitive layer is formed over a DNA 18. microarray.
- The device of Claim 17 wherein said photosensitive layer is formed over a 19. semiconductor wafer for forming an integrated circuit.
 - The device of Claim 1 wherein said selected optical pattern is an optical image.
 - The device of Claim 1 wherein said selected optical pattern is an optical code. 21.
 - The device of Claim, wherein said selected optical pattern is a pattern for 22.

20

exposing photosensitive material.

- 23. The device of Claim 1 wherein said programmable elements are diodes.
- 24. The device of Claim 1 wherein said programmable elements are zener diodes.
- 25. The device of q laim 1 wherein said programmable elements are transistors.
- 5 26. The device of Claim 1 further comprising semiconductor regions over which are formed conductive contacts for each programmable element.
 - 27. The device of Claim 1 wherein said substrate is a semiconductor substrate.
 - 28. The device of Claim 1 further comprising:

a radiation source applying radiation to a first side of said substrate; and

a radiation detector receiving a pattern of radiation that has passed through a second side of said substrate, each said filament at least partially blocking said radiation from passing through said substrate, said radiation detector generally electrical signals corresponding to said filament pattern.

- 29. The device of Claim 28 wherein said radiation source generates infra-red light.
- 30. The device of Claim 1 wherein said filament pattern is both optically detectable, by detecting said optical pattern, and electrically detectable, by detecting electrical shorts between said contacts.
- 31. The device of Claim 1 further comprising a read circuit electrically coupled to said elements for reading said elements after programming.
- 20 32. The device of Claim 31 wherein said read circuit is formed on said substrate.

33. The device of Claim 1 wherein said programmable elements comprise normally-shorting conductive filaments between two filament contact areas, said filaments forming an open circuit between said contact areas when blown during programming.

Jul. a 6

10

A method for selectively reflecting light comprising:

programming an array of elements on a surface of a substrate to create a pattern of reflective filaments; and

applying radiation to said surface, such that radiation is reflected from said filaments in a selected pattern.

- 35. The method of Claim 34, wherein said selected pattern conveys optical information.
- 36. The method of Claim 34 wherein said selected pattern is an optical image.
- 37. The method of Claim 34 wherein said selected pattern is an optical code.
- 10 38. The method of Claim 34 wherein said selected pattern is a pattern for exposing photosensitive material to light.
 - 39. The method of Claim 34 further comprising:

detecting a pattern of radiation that has passed through said substrate, said filaments at least partially blocking said radiation from passing through said substrate.

- 15 40. The method of Claim 34 wherein said elements are diodes.
 - 41. The method of Claim 34 wherein said elements are zener diodes.
 - 42. The method/of Claim 34 wherein said elements are transistors.
 - 43. The method of Claim 34 wherein said elements are normally-shorting conductive filaments between two filament contact areas.
- 20 44. The method of Claim 34 wherein said elements are fuses.
 - 45. The nethod of Claim 34 wherein said elements are anti-fuses.
